**Information Systems for Managing Design Guidelines for Manufacturing** Hafez Shurrab 2016-01-13 This book contains a study for investigating the definition of design guidelines for manufacturing (DGM) and how information systems should be built accordingly to support successful and smooth production

development projects. Firstly, the concept of guideline in manufacturing context and the characteristics of effective information systems and knowledge management are theoretically reviewed based on previous research. That is followed by an empirical case study at Volvo Car Group that either compliments or emphasizes facts and results, which are thoroughly analyzed and discussed in a following chapter. The book presents a clear definition for DGM and detailed criteria for how these guidelines should be constructed to live up to the proper level of design support. Then, what information systems have to offer in terms of functionalities and characteristics to enable effective management and continuous improvement of supportive DGM is produced. Finally, the book ends with reviewing the required support from the organization side that should be in place in order to facilitate successful transition to the proposed information system characteristics and related management practices.

**Design for Manufacturability** David M. Anderson 2020-05-11 Achieve any cost goals in half the time and achieve stable production with quality designed in right-the-first-time. Design for Manufacturability: How to Use Concurrent Engineering to Rapidly Develop Low-Cost, High-Quality Products for Lean Production is still the definitive work on DFM. This second edition extends the proven methodology to the most advanced product development process with the addition of the following new, unique, and original topics, which have never been addressed previously. These topics show you how to: Cut cost from 1/2 to 1/10 in 9 categories—with ways to remove that much cost from product charges and pricing Commercialize innovation—starting with Manufacturable Research and learning from the new section on scalability, you will learn how to design products and processing equipment to quickly scale up to any needed demand or desired growth. Design product families that can be built "on-demand" in platform cells that also "mass customize" products to-order Make Lean production easier to implement with much more effective results while making build-to-order practical with

spontaneous supply chains and eliminating forecasted inventory by including an updated chapter on "Designing Products for Lean Production" The author's 30 years of experience teaching companies DFM based on pre-class surveys and plant tours is the foundation of this most advanced design process. It includes incorporating dozens of proven DFM guidelines through up-front concurrent-engineering teamwork that cuts the time to stable production in half and curtails change orders for ramps, rework, redesign, substituting cheaper parts, change orders to fix the changes, unstable design specs, part obsolescence, and late discovery of manufacturability issues at periodic design reviews. This second edition is for the whole product development community, including: Engineers who want to learn the most advanced DFM techniques Managers who want to lead the most advanced product development Project team leaders who want to immediately apply all the principles taught in this book in their own micro-climate Improvement leaders and champions who want to implement the above and ensure that the company can design products and versatile processing equipment for low-volume/high-mix product varieties Designing half to a tenth of cost categories can avoid substituting cheap parts, which degrades quality, and encourages standardization and spontaneous supply chains, which will encourage Lean initiatives. Using cellular manufacturing to shift production between lines for mixed production of platforms and build-to-order to offer the fastest order fulfillment can beat any competitors' delivery time.

**Design for Manufacturing** Corrado Poli 2001-11-29 Design for Manufacturing assists anyone not familiar with various manufacturing processes in better visualizing and understanding the relationship between part design and the ease or difficulty of producing the part. Decisions made during the early conceptual stages of design have a great effect on subsequent stages. In fact, quite often more than 70% of the manufacturing cost of a

product is determined at this conceptual stage, yet manufacturing is not involved. Through this book, designers will gain insight that will allow them to assess the impact of their proposed design on manufacturing difficulty. The vast majority of components found in commercial batch-manufactured products, such as appliances, computers and office automation equipment are either injection molded, stamped, die cast, or (occasionally) forged. This book emphasizes these particular, most commonly implemented processes. In addition to chapters on these processes, the book touches upon material process selection, general guidelines for determining whether several components should be combined into a single component or not, communications, the physical and mechanical properties of materials, tolerances, and inspection and quality control. In developing the DFM methods presented in this book, he has worked with over 30 firms specializing in injection molding, die-casting, forging and stamping. Implements a philosophy which allows for easier and more economic production of designs Educates designers about manufacturing Emphasizes the four major manufacturing processes

*A Framework for Set-based Manufacturing Analysis and Visual Feedback* Wonmo Kim 2015 Design changes and subsequent verifications happen frequently during the development stages for a complex product. These iterative loops between design, manufacturing, and testing delay the entire product development process. This research introduces a framework that shortens or reduces these iterative loops by letting designers perform manufacturing feasibility checks on multiple manufacturing processes at the early design stage. If feedback information for manufacturability of a design can be delivered to designers in a timely manner, then it can significantly reduce the entire product development cycle. A set-based

manufacturing analysis and feedback framework is proposed to provide early, fast, and informative visual feedback on manufacturability to designers for a complex product for multiple manufacturing processes. Instead of applying automatic reasoning algorithms, questions regarding part geometry are asked directly of designers. Using the obtained geometric information, the framework analyzes manufacturability in terms of part geometry with respect to a given set of process capabilities based on Design for Manufacturing (DFM) guidelines. To minimize the number of questions, a method that derives process decision blocks for manufacturing process families is proposed. A manufacturing process family is a set of processes that share the same geometric parameters among related DFM guidelines. The process decision block is then refined either heuristically using statistical data from a product domain or analytically based on geometric connections between parameters in the decision block. Using the process decision block, infeasible manufacturing processes are quickly screened out for subsequent analysis. Moreover, the proposed framework provides efficient and dynamic visual feedback for geometric advice at the feature level for each selected manufacturing process. Through dynamic visual feedback generation, designers can quickly search for design alternatives while maintaining manufacturability.

**Design for Additive Manufacturing** Tom Page 2012-01 Additive Manufacturing is a new manufacturing method which adds material layer-by-layer to produce an object. This report set out to investigate a number of questions relating to Additive Manufacturing and its implications on current design practice, products and users. An introduction to Additive Manufacture as a process and how it has evolved from Rapid Prototyping is given. This report documents the Design for Manufacture constraints which Injection Moulding, a traditional manufacturing method, incurs and gives details of why most do not apply to Additive Manufacturing. The main freedom of traditional constraints comes from the nature of Additive Manufacturing being tool-less and therefore considerations such as constant wall thickness and non-

undercutting geometry are not applicable. New constraints when 'Designing for Additive Manufacture' are given and explained including the need to remove support material or excess resin from within hollow geometry. Further still this report investigates consumer awareness and reception to Additive Manufacture through primary research in the form of a questionnaire - the first research of its kind into this topic.

Containing more than 300 equations and the extensive data necessary to estimate manufacturing and assembly cost during product design, benchmarking, and "should cost" analysis, this textbook gives students modern and effective tools for analyzing injection molding, sheet metalworking, die casting, powder metal processing costs, sand and investment casting, and hot forging. It includes discussions of the influence of the application of design for manufacture and assembly, material selection and economic ranking of processes, the effect of reduced assembly difficulties on product quality, the links between computer-aided design solid models and design analysis tools, and more.

### **Integrating Design and Manufacturing for Competitive Advantage** Gerald I.

Susman 1992 With more emphasis being placed on the cost and quality of new products and on reducing the lead time to develop them, attention is turning to the increasingly important topic of design for manufacturability (DFM). This involves the collaboration among research and development, manufacturing, and other company functions and is aimed at accelerating the new product development process from product conception to market introduction. A company can create a competitive advantage for itself by managing the process and its related organizational dynamics effectively. This book includes chapters by experts who focus on the development of strategic capabilities, such as the systematic

development and introduction of new technologies into products and processes, as well as the use of appropriate tools and techniques to facilitate communication and problem-solving between design and manufacturing. Other topics covered include learning from experience; the social, political, and cultural contexts within which key players interact; and the degree to which management of information and development of an effective structure are critical to new product development success. The information-intensive nature of the product development process is demonstrated throughout the book. The final chapter contains a model that links the role of information in the development of products to a company's capability to organize, process, and learn from that information.

*Product Simplification Design Improvement by Using DFMA Method* Ni Yen Tan 2012 Design for Manufacturing and Assembly (DFMA) is a tool for designing or redesign product. The advantage of DFMA is able to reduce manufacturing cost. The main objective of this project is to propose a new design for price labeler. Apart from that, the manufacturing cost, assembly cost and time are also analysed to support the improvement. The analysed were carried out through dismantle a unit of product, functioning of each component and 3D modelling using SolidWork software and lastly is using DFMA design guidelines to generate a new design. The selection criteria for a good design are based on manufacturing cost and assembly time. Finally, the chosen design was proven meet all needed criteria by improving 16.29% of the design efficiency. The existing product design efficiency is 26.62% and the new propose of design is 41.26%. The labour cost also manages to reduce RM0.1940 per product. For the Design for Manufacturing (DFM) part, the better manufacturing process chooses is injection moulding and the material used is Thermoplastic. Since the material choose is Thermoplastic, so will maintain the original material which is Acrylonitrile butadiene styrene (ABS). In

this study, the overall cost reduction for DFMA is RM0.19 per product which is RM1.50 reduce to RM1.31, the percentage reduction is 12.67%.

Design for Manufacturing and Assembly O. Molloy 2012-12-06 In order to compete in the current commercial environment companies must produce greater product variety, at lower cost, all within a reduced product life cycle. To achieve this, a concurrent engineering philosophy is often adopted. In many cases the main realization of this is Design for Manufacture and Assembly (DFM/A). There is a need for in-depth study of the architectures for DFM/A systems in order that the latest software and knowledge-based techniques may be used to deliver the DFM/A systems of tomorrow. This architecture must be based upon complete understanding of the issues involved in integrating the design and manufacturing domains. This book provides a comprehensive view of the capabilities of advanced DFM/A systems based on a common architecture.

A Practical Guide to Design for Additive Manufacturing Olaf Diegel 2019-05-21 This book provides a wealth of practical

guidance on how to design parts to gain the maximum benefit from what additive manufacturing (AM) can offer. It begins by describing the main AM technologies and their respective advantages and disadvantages. It then examines strategic considerations in the context of designing for additive manufacturing (DfAM), such as designing to avoid anisotropy, designing to minimize print time, and post-processing, before discussing the economics of AM. The following chapters dive deeper into computational tools for design analysis and the optimization of AM parts, part consolidation, and tooling applications. They are followed by an in-depth chapter on designing for polymer AM and applicable design guidelines, and a chapter on designing for metal AM and its corresponding design guidelines. These chapters also address health and safety, certification and quality aspects. A dedicated chapter covers the multiple post-processing methods for AM, offering the reader practical guidance on how to get their parts from the AM machine into a shape that is ready to use. The book's final chapter outlines future applications of AM. The main benefit of the book is its highly practical approach: it provides directly applicable, "hands-on" information and insights to help readers adopt AM in their industry
